### **DETAILED ACTION**

## Notice to Applicant

1. This communication is in response to the amendments filed 5/4/04, 7/16/04 and 11/11/04. Claims 1-10 and 22-36 are pending.

#### Continued Examination Under 37 CFR 1.114

2. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 5/4/04 has been entered.

### Specification

3. The objection to the amendment filed 11/12/02 as adding new matter is hereby withdrawn due to the amendments filed 5/4/04 and 7/19/04.

### Statutory Subject Matter

4. As per claims 1-10, to the extent that the Examiner understands the claimed invention, she interprets Applicant's recitation of "A processor-readable medium comprising code representing instructions to cause a computer processor to..." to mean that the processor is a computer processor, the medium is a computer-readable medium, and the instructions are computer-executable instructions.

Application/Control Number: 09/487,361 Page 3

Art Unit: 3626

# Claim Rejections - 35 USC § 112

5. The rejection of claims 5-10 under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement, is hereby withdrawn due to the amendment filed 5/4/04.

- 6. The following is a quotation of the second paragraph of 35 U.S.C. 112:

  The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.
- 7. Claims 1-10 and 34-35 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

As per claim 1, it is unclear to the Examiner how the recited "guest profile information associated with similar guests" is distinct from the recited guest information. Moreover, since applicant has amended the claim to remove the recitation of "historical information associated with similar guests..." it is unclear which "historical data" is used for the forecast demand.

Furthermore, from the current wording of the claim, it is unclear which steps/functions are encoded to be executed/performed by a processor as a part of the claimed invention. In particular, the claimed invention apparently recites instructions for receiving guest information, receiving a room request, and determining a room rate. The claim further recites that the room rate determination is based upon several comparisons, but the claim does not positively or actively recite any comparison steps. Thus it is unclear whether the implied comparison steps are a function of the claimed

Application/Control Number: 09/487,361

Art Unit: 3626

invention, or whether these comparisons are performed beyond the scope of the present invention.

A similar analysis may be applied to claims 2 and 3, which are similarly worded.

As per claim 2, the present claim recites, "determine a room rate for said second guest based on a comparison said guest information and guest profile information associated with similar guest...". Insofar as claim 2 is dependent from claim 1, which also recites "guest information" and "guest profile information", it is unclear which "guest information" or "guest profile information" is being referenced in the current claim lines 6-8.

As per claim 3, the present claim recites, "determine a room rate for said second guest based on a comparison said guest information and guest profile information associated with similar guest...". Insofar as claim 3 is dependent from claim 1, which also recites "guest information" and "guest profile information", it is unclear which "guest information" or "guest profile information" is being referenced in the current claim lines 6-8.

Claims 2-10 also inherit the deficiencies of claim 1, through dependency and are also rejected.

8. Claim 34 recites the limitation "a second interface from the plurality of interfaces being configured to communicate with the second interface system" in lines 2-4. There is insufficient antecedent basis for this limitation in the claim. Claims 22, 29 and 34 do not recite a first or second interface system.

Claim 35 inherits the deficiencies of claim 35 through dependency, and is also rejected.

#### Election/Restrictions

9. The Applicant's arguments in the 5/4/04 response regarding the restriction requirement for claims 11-21 are most due to the amendment filed 7/16/04.

## Claim Rejections - 35 USC § 103

- 10. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 11. Claims 1-4 and 22-36 are rejected under 35 U.S.C. 103(a) as being unpatentable over Tagawa (US Patent No. 5,732,39) in view of "Red Roof Inns Implements. . ." (referred to hereinafter as Red) and in further view of Smith et al (USPN 6,085,164).

As per claim 1, Tagawa teaches computer-implemented method (i.e. processor readable medium comprising code for causing a processor to perform the following method):

- receive guest information from a first guest, said guest information comprising at least one of: a name, a market segment, and a point of origin (Figures 5a-5b; col. 12, lines 30-64; col. 13, lines 17-20)

- receive a room request from said first guest, the room request including at least one of: an arrival date, length of stay, a room feature; (Figures 5a-5b; col. 12, lines 30-64)
- determine a first room rate for said first guest (col. 13, lines 21-25)

Tagawa teaches a method/system to assist a user (e.g. guest) in searching for and reserving hotel accommodations. The system receives the user's selection criterion (i.e. guest information and room request information). The guest and room request information may include the type of hotel the guest is seeking (i.e. market segment—budget, mid-range, deluxe) (col. 12, lines 51-55), a guest name (col. 13, lines 17-20) and the guest's desired arrival date and length of stay (i.e. check-in/check-out dates). Furthermore, the system determines a room rate for the guest (i.e. the total cost for the reservation). Tagawa also teaches that the system may offer hotel-pricing specials for certain participating vendors/hotels if the room supply (i.e. inventory) allows (col. 13, lines 32-36).

Tagawa does not specifically teach that room rate is based on a comparison between guest information and guest profile information associated with similar guests, and a comparison between the room request and a forecast of demand of a similar request, said forecast of demand based on historical data.

Red teaches the use of a revenue management system for hotel reservations that analyzes (i.e. compares) current and historical data on room requests and guest occupancy to forecast room demand and to determine room rates. (Red, paragraph 1). At the time of the Applicants' invention, it would have been obvious to one of ordinary

skill in the art to modify the teaching of Tagawa with the teaching of Red to consider (compare) current and historical room request and guest data (i.e. occupancy levels) to forecast room demand and to determine a room price. As suggested by Red, one would have been motivated to do this to maximize hotel revenue and to ensure that the rooms are sold to the appropriate guest at the best price. (Red, paragraph 2).

Tagawa and Red do not expressly disclose the use of "guest profile" information in calculating room rates. Smith discloses a system/method that determines travel rates using customer profile information (i.e. information associated with similar guests/customers) and forecast demand information based upon historical data (col. 3, lines 22-31; col. 5, lines 45-54; col. 8, lines 23-34). At the time of the applicant's invention, it would have been obvious to one of ordinary skill in the art to further modify the method of Tagawa and Red in combination with the teaching of Smith to include "customer profile" for similar customers among the factors used to calculate a travel rate (e.g. room rate for a guest). As suggested by Smith, one would have been motivated to include this feature to determine an optimal value for the travel inventory based upon certain various types of customers, and maximize revenue (col. 3, lines 23-31).

As per claim 2, the limitations of this claim are substantially similar to those of claim 1 and as such are addressed in rejection of claim 1. Claim 2 differs from claim 1 in that it recites receiving guest information and a room request from a second guest. It is respectfully submitted that the method taught by Tagawa in view of Red (receiving guest information, receiving room request data, analyzing current and historical data to forecast demand and to determine a room rate) would accommodate one or more users (i.e. first guest, second guest, third guest. . .) making a (hotel) reservation. Thus, a method that receives of the guest/room request information from a first user (guest) and determines a price for that user would also be able to receive guest information and room data and determine a room rate for different users (i.e. second, third guests).

Claim 2 further differs from claim 1 it recites that the second room request is similar to the first room request and that the second room rate is different from the first room rate. It is unclear from Tagawa and Red whether the room rate that is determined is based on similar room request data (data similar among different guests) and whether the room rate for a similar room request differs from guest to guest. However, Red does teach a method of processing current and historical guest information to offer room rates that will maximize revenue for the hotel. At the time of the Applicant's invention, it would have been obvious to one of ordinary skill in the art that the method of Tagawa in view of Red includes generating different room rates for different guests, even when the room request data for those guests is similar. One would have been motivated to offer differential or special pricing to different guests for similar rooms to appeal to various market segments (i.e. senior, motor club members, frequent travelers), thereby maximizing hotel reservations and revenue in light of forecasted market demand as suggested by Red. (paragraph 1)

As per claim 3, the limitations of this claim are substantially similar to those of claim 1 and as such are addressed in rejection of claim 1. Claim 3 differs from claim 1 in that it recites receiving guest information and a room request from a second guest. It is respectfully submitted that the method taught by Tagawa in view of Red (receiving

guest information, receiving room request data, analyzing current and historical data to forecast demand and to determine a room rate) would accommodate one or more users (i.e. first guest, second guest, third guest. . .) making a (hotel) reservation. Thus, a method that receives the guest/room request information from a first user (guest) and determines a price for that user would also be able to accept guest information and room request data determine room rates for different users (i.e. second, third guests).

Claim 3 further differs from claim 1 it recites that the second guest data is similar to the first guest information and that the second room rate is different from the first room rate. Red teaches the use of a revenue management system for hotel reservations that analyzes (i.e. compares) current and historical data on room requests and guest occupancy (i.e. guest profile information associated with similar guests) to forecast room demand and to determine room rates. (Red, paragraph 1). Tagawa and Red do not expressly discloses that a determined room rate for may differ for similar guest(s). However, Red does disclose that the purpose of the disclosed system is to allow rooms to be sold at the right price on a given day. (par. 1) At the time of the Applicant's invention, it would have been obvious to one of ordinary skill in the art that the method of Tagawa in view of Red includes generating different prices/room rates for similar guests. As suggested by Red, it would be obvious to include this feature so hotels could set room rates that would maximize revenues under various forecasted market demand conditions. (Red, paragraphs 1-4) In other words, hotels would charge according to what the market will bear and not base charges solely on guest data similarities.

As per claim 4, Tagawa, Red, and Smith teach the computer-implemented method of claim 1 as explained in the rejection of claim 1. Furthermore, Tagawa teaches a method, wherein the room request from the first guest includes arrival date, a length of stay, and at least one room attribute. (Tagawa: col. 12, lines 35-58) The user inputs the arrival date (i.e. check-in date), length of stay (i.e. check-in and check-out dates) and room attributes (i.e. hotel preference; lodging category).

# [claim 22] Tagawa teaches a system, comprising:

- an interface configured to receive guest information and a room request from a first guest; and (Figures 5a-5b; col. 12, lines 30-64; col. 13, lines 17-20)
- a processor in communication with the interface, the processor being configured to determine a room rate (col. 13, lines 17-21)

Tagawa teaches a system including an interface to assist a user (e.g. guest) in searching for and reserving hotel accommodations. The system receives the user's selection criterion (i.e. guest information and room request information). The guest and room request information may include the type of hotel the guest is seeking (i.e. market segment—budget, mid-range, deluxe) (col. 12, lines 51-55), a guest name (col. 13, lines 17-20) and the guest's desired arrival date and length of stay (i.e. check-in/check-out dates). Furthermore, the system determines a room rate for the guest (i.e. the total cost for the reservation). Tagawa also teaches that the system includes a processor to offer hotel-pricing specials for certain participating vendors/hotels if the room supply (i.e. inventory) allows (col. 13, lines 32-36).

Tagawa does not specifically teach that room rate is based on a comparison between guest information and guest profile information associated with similar guests, and a comparison between the room request and a forecast of demand of a similar request, said forecast of demand based on historical data.

Red teaches the use of a revenue management system for hotel reservations that analyzes (i.e. compares) current and historical data on room requests and guest occupancy to forecast room demand and to determine room rates. (Red, paragraph 1). At the time of the Applicants' invention, it would have been obvious to one of ordinary skill in the art to modify the teaching of Tagawa with the teaching of Red to consider (compare) current and historical room request and guest data (i.e. occupancy levels) to forecast room demand and to determine a room price. As suggested by Red, one would have been motivated to do this to maximize hotel revenue and to ensure that the rooms are sold to the appropriate guest at the best price. (Red, paragraph 2).

Tagawa and Red do not expressly disclose the use of "guest profile" information in calculating room rates. Smith discloses a system/method that determines travel rates using customer profile information (i.e. information associated with similar guests/customers) and forecast demand information based upon historical data (col. 3, lines 22-31; col. 5, lines 45-54; col. 8, lines 23-34). At the time of the applicant's invention, it would have been obvious to one of ordinary skill in the art to further modify the method of Tagawa and Red in combination with the teaching of Smith to include "customer profile" for similar customers among the factors used to calculate a travel rate (e.g. room rate for a guest). As suggested by Smith, one would have been motivated to

include this feature to determine an optimal value for the travel inventory based upon certain various types of customers, and maximize revenue (col. 3, lines 23-31).

[claim 23] Tagawa teaches system wherein the interface is configured to receive guest information including at least one of a name, a market segment, and a point of origin. (Figures 5a-5b; col. 12, lines 30-64; col. 13, lines 17-20)

[claim 24] Tagawa teaches a reservation system comprising, further comprising a centralized database in communication with the interface and the processor. (col. 12, lines 53-58) Tagawa further discloses that the centralized database may be queried and data may be retrieved based upon the guest's/user's preferences, but does not disclose that the database stores guest profile information or historical information. Smith system/method that stores historical and customer profile information (i.e. information associated with similar guests/customers) and forecast demand information based upon historical data (col. 3, lines 22-31; col. 5, lines 45-54; col. 8, lines 23-34, 62-64). At the time of the applicant's invention, it would have been obvious to one of ordinary skill in the art to further modify the method of Tagawa and Red in combination with the teaching of Smith to store "customer profile" for similar customers and historical information. As suggested by Smith, one would have been motivated to include these features to facilitate the determination an optimal value for the travel inventory based upon certain various types of customers, and maximize revenue (col. 3, lines 23-31).

[claim 25] Tagawa teaches a system wherein a centralized database is configured to store information associated with a first lodging property and information associated with a second lodging property, the information associated with the first lodging property and the information associated with the second lodging property each including an inventory of rooms. (col. 12, lines 45-64)

[claim 26] Tagawa teaches a further comprising:

- a first external database associated with the first lodging property, the first external database being configured to store inventory information associated with rooms of the first lodging property including availability information and pricing information of rooms of the first lodging property; and (col. 13, lines 32-43—e.g. plurality of vendor or local databases)
- a second external database associated with the second lodging property, the second external database being configured to store inventory information associated with rooms of the second lodging property including availability information and pricing information regarding each of said inventory of rooms of rooms of the second lodging property. (col. 13, lines 32-43--- e.g. plurality of vendor or local databases)
   [claim 27] Tagawa teaches a system further comprising:

[claim 27] Tagawa teaches a system further comprising:

a reservations management system configured to communicate with the interface and the processor (col. 10, lines 17-41;col. 12, line 30-col. 13, line 23), the reservations management system being configured to communicate with a first reservation system and a second reservation system different from the first reservation system (col. 13, lines 32-43--- e.g. plurality of vendor or local databases), the reservations management

system being configured to make a reservation for a room of at least one of the first lodging property and the second lodging property based on the guest information, the reservations management system being further configured to update information in the centralized database associated with the reservation, and the reservations management system being further configured to update inventory information in at least one of the first external database and the second external database based on the reservation. (col. 13, lines 37-40)

[claim 28] Tagawa teaches a system wherein the reservations management system is configured to query the centralized database for inventory information associated with rooms of the first lodging property and for inventory information associated with rooms of the second lodging property. (col. 12, lines 53-59)

[claim 29] Tagawa, Red and Smith teach the system of claim 22 as explained in the rejection of claim 22. Tagawa also discloses a system comprising a reservations management system configured to communicate with the interface and the processor. the reservations management system being configured to communicate with a first reservation system and a second reservation system different from the first reservation system, the reservations management system being configured to make a reservation for a room of at least one of a first lodging property and a second lodging property based on the guest information. (col. 12, lines 45-col. 13, line 7; col. 13, lines 17-25;32-44)

Application/Control Number: 09/487,361

Art Unit: 3626

[claim 30] Tagawa teaches a system wherein the first reservation system includes at least one of a global distribution system and a property management system that controls an inventory of at least one of a hotel and a hotel chain. (col. 13, lines 37-43) [claim 31] Tagawa teaches a wherein the interface includes at least one of a reservation agent terminal, a direct access client, and a web server coupled to a web browser, the interface being in communication with the first reservation system.

(Tagawa: col. 9, line 55-col. 10, line 9; col. 10, lines 17-41—Internet communication to vendors, clients, CRS's)

[claim 32] Tagawa teaches a system of claim 29, wherein the reservations management system is configured to cause the processor to determine a room rate for the first guest. (col. 13, line 17-23)

[claim 33] Tagawa teaches a travel reservation system as disclosed in the rejections of claims 22 and 29, but does not expressly disclose the details of managing the revenue or yield the lodging properties. However, Tagawa does disclose teaches that the system includes a processor to offer hotel pricing specials for certain participating vendors/hotels if the room supply (i.e. inventory) allows (col. 13, lines 32-36). Red teaches the use of a revenue management system in a hotel reservations system. (Red, paragraph 1). At the time of the Applicants' invention, it would have been obvious to one of ordinary skill in the art to modify the system of Tagawa with the teaching of Red to manage hotel revenue/yield when processing reservations. As suggested by Red, one would have been motivated to do this to maximize hotel revenue and to ensure that the rooms are sold to the appropriate guest at the best price. (Red, paragraph 2).

[claim 34-35] Tagawa teaches a system, which includes a plurality of interfaces which communication with various reservation systems, and/or other client systems (col. 9, line 55-col. 10, line 9; col. 10, lines 17-41) Moreover, the data from the plurality of sources (e.g. various CRS's, hotel, airline, and car reservation systems) are retrieved and presented in the format(s) required by the different data recipients in the system(col. 10, lines 20-41—format conversion performed as needed).

[claim 36] Tagawa teaches a reservation management system comprising:

- a centralized database configured to store information associated with an inventory
  of rooms for a first lodging property and information associated with an inventory of
  rooms for a second lodging property; (col. 12, lines 23-64)
- a first external database in communication with the centralized database, the first external database being configured to store inventory information associated with the first lodging property, the inventory information including availability information and pricing information associated with the first lodging property; (col. 13, lines 32-43—e.g. plurality of vendor or local databases)
- a second external database in communication with the centralized database, the second external database being configured to store inventory information associated with the second lodging property, the inventory information including availability information and pricing information associated with the second lodging property; and(col. 13, lines 32-43—e.g. plurality of vendor or local databases)

- a reservations management system in communication with the centralized database and at least one of the first external database and the second external database (col. 10, lines 17-41; col. 12, lines 45-col. 13, line 7; col. 13, lines 17-25;32-44), the reservations management system being configured to determine a room rate for a guest (col. 13, lines 17-23).

Page 17

Tagawa discloses that the system determines a room rate for the guest (i.e. the total cost for the reservation). Tagawa also teaches that the system may offer hotel-pricing specials for certain participating vendors/hotels if the room supply (i.e. inventory) allows (col. 13, lines 32-36), but does not specifically teach that room rate is based on a comparison between guest information and guest profile information associated with similar guests, and a comparison between the room request and a forecast of demand of a similar request, the forecast of demand based on historical data (retrieved from the database).

Red teaches the use of a revenue management system for hotel reservations that analyzes (i.e. compares) current and historical data on room requests and guest occupancy to forecast room demand and to determine room rates. (Red, paragraph 1). At the time of the Applicants' invention, it would have been obvious to one of ordinary skill in the art to modify the teaching of Tagawa with the teaching of Red to consider (compare) current and historical room request and guest data (i.e. occupancy levels) to forecast room demand and to determine a room price. As suggested by Red, one would have been motivated to do this to maximize hotel revenue and to ensure that the rooms are sold to the appropriate guest at the best price. (Red, paragraph 2).

Tagawa and Red do not expressly disclose the use of "guest profile" information in calculating room rates. Smith discloses a system/method that determines travel rates using customer profile information (i.e. information associated with similar guests/customers) and forecast demand information based upon historical data (col. 3, lines 22-31; col. 5, lines 45-54; col. 8, lines 23-34, lines 62-64). At the time of the applicant's invention, it would have been obvious to one of ordinary skill in the art to further modify the method of Tagawa and Red in combination with the teaching of Smith to include "customer profile" for similar customers among the factors used to calculate a travel rate (e.g. room rate for a guest). As suggested by Smith, one would have been motivated to include this feature to determine an optimal value for the travel inventory based upon certain various types of customers, and maximize revenue (col. 3, lines 23-31).

12. Claims 5-7 and 9-10 are rejected under 35 U.S.C. 103(a) as being unpatentable over Tagawa, Red, and Smith as applied to claims 1 and 4, and further in view of Kerr et al (USPN 5,404,291).

As per claim 5, Tagawa, Red, and Smith in combination teach the computer-implemented method of claim 4 as explained in the rejections of claim 1. Tagawa further discloses a method of processing a customer room request, but does not specifically disclose the details of organizing hotel inventory based on room attributes to coordinate customer reservations. Kerr discloses a computer-implemented method (i.e.

Application/Control Number: 09/487,361 Page 19

Art Unit: 3626

processor readable medium comprising code for causing a processor to perform the following method):

- organize an inventory of hotel rooms as a plurality of attribute combinations, wherein a first attribute combination (room-rate type "ij") represents a second attribute combination (rate-category "i") and a third attribute combination (room-type "j"), wherein said second attribute combination is different from said third attribute combination; (Kerr: col. 3, lines 12-23; col. 125, lines 16-60; col. 126, lines 55-67)
- determine a number of rooms in said inventory represented by each of said attribute combinations; (Kerr: col. 3, line 55-col. 4, line 3)
- identify each attribute combination from said plurality of attribute combinations that corresponds to said at least one room attribute in said room request; and (Kerr: Figure 2; col. 5, lines 18-24; col. 6, lines 15-24)
- determine whether said room request can be met from said inventory based on a number of rooms available for each identified attribute combination.
   (Kerr: Figure 2; col. 5,lines 18-24; col. 7, lines 4-19)

At the time of the Applicant's invention, it would have been obvious to one of ordinary skill in the art to further modify the computer-implemented method of Tagawa, Red, and Smith in combination with the teaching of Kerr to analyze availability information based on room attribute information in a customer reservation request. As suggested by Kerr, one would have been motivated to do this to accommodate customer preferences (col.

4, lines 4-12) and to facilitate reservation management by offering more accurate chain inventory status, and to ultimately maximize hotel profits. (col. 2, lines 7-19)

As per claim 6, Tagawa, Red, and Smith disclose processing customer reservation requests as explained in the rejection of claims 1 and 4, but do not specifically disclose adjusting the number of available rooms if a customer request can be met. However, Tagawa does disclose verifying up-to-date (i.e. real-time) hotel vendor inventory before accepting a customer reservation request (Tagawa: col. 13, lines 32-43). Tagawa further discloses a system that updates the inventory of other travel accommodations (i.e. car rentals) when it is determined that a customer request can be met. (col. 13, lines 62-66). Kerr teaches adjusting said number of rooms available for each identified attribute combination if said room request can be met from said inventory. (Kerr: Figure 2; col. 3, lines 3-23—System checks the inventory of the room to determine if it can be sold to a requestor and updates the inventory accordingly.) At the time of the Applicant's invention, it would have been obvious to one of ordinary skill in the art to further modify the method of Tagawa, Red, and Smith in combination with the teaching of Kerr to update (i.e. adjust) availability information based on whether a customer reservation request can be met. As suggested by Kerr, one would have been motivated to do this to accommodate customer preferences (col. 4, lines 4-12) and to improve the accuracy of chain inventory status. (col. 2, lines 7-19)

As per claim 7, Tagawa, Red, Smith and Kerr teach claim 5 as explained in the rejection of claim 5. Tagawa, Red, and Smith do not specifically disclose the details of declining a room request. Kerr teaches a method further comprising denying a room

request if the room request cannot be met from the inventory. (Kerr: col. 3, lines 40-col. 6, line 61-col. 7, line 9) Kerr discloses that the reservation manager may set maximum levels for each rate type, room type and rate/room combination and further discloses that before a sale is completed in response to a request, availability information must be verified. It is respectfully submitted that one of ordinary skill in the art would have understood that this results of this verification process would include the acceptance of a request if the availability rules are not violated (i.e. inventory is sufficient) or the denial of a room request if the availability rules are violated (i.e. if request cannot be met from the available inventory). At the time of the Applicant's invention, it would have been obvious to one of ordinary skill in the art to modify the method of Tagawa, Red, and Smith with the teaching of Kerr to deny a room request if the request cannot be met by the inventory. One would have been motivated to do this to provide timely notification to the traveler that other arrangements are necessary, thus minimizing customer inconvenience and dissatisfaction with the hotel chain.

As per the limitations of claims 9-10, Tagawa discloses a method for receiving a customer request for a hotel room (Tagawa: col. 12,line 31-col. 13, line 43,) but does not disclose the use of forecast demand or determining room rates based upon room availability. Red discloses a method wherein the number of rooms available is based on forecast demand and wherein the room rate (i.e. first room rate) is based upon the number of rooms available (i.e. occupancy rate). (Red: paragraphs 1 and 2) At the time of the Applicant's invention, it would have been obvious to one of ordinary skill in the art to modify the method of Tagawa with the teaching of Red to determine the

number of available rooms based on forecast demand and to determine price based upon room availability. As suggested by Red, one would have been motivated to do this so hotels could set room rates that would maximize revenues under various forecasted market demand conditions and according to what the market will bear. (Red, paragraph 2)

13. Claim 8 is rejected under 35 U.S.C. 103(a) as being unpatentable over Tagawa, Red, Smith and Kerr as applied to claim 6 above, and further in view of Jung et al (USPN 4,775, 936).

As per claim 8, Tagawa, Red and Kerr teach claim 6 as explained in the rejection of claim 6. Tagawa, Red, and Kerr do not specifically teach that the number of rooms includes an allowed number of overbooked rooms, but Red does disclose a method that makes recommendations regarding overbooking opportunities. (Red: paragraph 1)

Jung discloses a system wherein the available inventory includes an allowed overbooking level for the inventory (e.g. number of overbooked rooms, seats, fleet vehicles). (col. 2,lines 29-53; col. 4,lines 56-col. 5, line 30; col. 9, line 64-col. 10, line 5)

At the time of the Applicant's invention, it would have been obvious to one of ordinary skill in the art to further modify the method of Tagawa, Red, Smith and Kerr with the teaching of Jung to include an allowed number of overbooked rooms among the number of rooms available. As suggested by Jung, one would have been motivated to do this to maximize profits by using the total capacity of the hotel and to guard against the

10, line 5)

# Response to Arguments

14. Applicant's arguments filed 5/4/04, 7/19/04, and 11/11/04 have been fully considered but they are not persuasive.

(A) On pages 9-10 of the 7/19/04, Applicant provides a summary of the in-person interview. However, the Applicant also comments that the Examiner recognized during the interview that neither the Tagawa nor *Red Roof Release...* reference disclosed or suggested guest information and guest profile information associated with similar guests.

In response, Examiner notes that no such agreement with respect to the claims or the prior art was reached, as noted in the Interview Summary dated and provided to Applicant's representative on 7/2/04. During the interview, the Applicant discussed that the use of a guest profile and historical information for determining prices for similar room requests/similar guests was an important aspect of the invention. Also discussed was the possibility of including additional claim language to clarify the terms "similar" or "information associated with similar guests."

The Examiners indicated that the prior art rejections would be reconsidered in light of any amendments made to emphasize incorporation of guest profile information, and any amendments to the claim language clarifying points of similarity between guests or rooms requests. In the absence of a definition in the specification or a

recitation in the claim language (e.g. specific attributes or qualities) explaining how customers are determined to be "similar" to one another, the Examiner must give the claim the broadest reasonable interpretation and apply art accordingly.

(B) Additional arguments submitted by the applicant are directed toward the new/amended features.

Applicant's arguments with respect to these features have been considered but are most in view of the new ground(s) of rejection.

### Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Rachel L. Porter whose telephone number is 703-305-0108. The examiner can normally be reached on M-F, 9:30-6:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Joseph Thomas can be reached on (703) 305-9588. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
